Thor is a project aiming to provide a fully usable finger-friendly desktop manager for touchscreen devices. It is coded using web technologies to make things easy for developers, while using last improvements in web world, such as HTML5, CSS3, WebGL, and others.

Thor is now in a pre-alpha state, and is working (at the moment) under Adobe Air framework. **We are seeking any help as to provide a custom runtime that would make use of Webkit.**

Expect a demo release soon, with all the main features implemented.
